

**REPORT OF 100 PINE STREET BUILDING
SAN FRANCISCO, CALIFORNIA**

By

William M. Ewing, CIH

January 12, 2007

William M. Ewing, CIH is the Technical Director for Compass Environmental, Inc., located in Kennesaw, Georgia located at 1751 McCollum Parkway, NW, Kennesaw, GA 30144-5908. He is certified in the comprehensive practice of industrial hygiene by the American Board of Industrial Hygiene (CP 2627). He completed his core examination in 1980 and his comprehensive practice in 1983. Industrial Hygiene is the science devoted to the identification, evaluation and control of occupational and environmental health hazards. He earned the sub-specialty of Indoor Environmental Quality in 1993. He was awarded Fellow Member status in 1995 by the American Industrial Hygiene Association (AIHA). He is a member and past chair of the AIHA Indoor Environmental Quality Committee and the AIHA Practices, Standards and Guidelines Committee. He belongs to the American Society of Testing and Materials (ASTM) and is a member of Committee D 22 which focuses on sampling and analytical techniques for environmental contaminants. He is a voting member of Subcommittee D 22.07 on asbestos which has as its charge methods for sampling and analysis of asbestos in air, dust, and other matrices.

Mr. Ewing has 28 years experience in the field of industrial hygiene. Approximately half of his work has concerned protecting workers from asbestos exposure. He was formerly the director of the U.S. Environmental Protection Agency (EPA) sponsored Asbestos Information Center, housed at the Georgia Tech Research Institute. He co-authored the EPA model training programs for the accreditation of persons who inspect buildings for asbestos, develop asbestos management plans, and supervise asbestos abatement projects. He has served on peer review panels for the National Institute for Occupational Safety and Health (NIOSH), the National Institute of Building Sciences (NIBS), the EPA, Army, and Navy. He has published over a dozen articles on the subject of asbestos, including two specific to asbestos in surface dust.

Mr. Ewing has personally inspected over 2000 buildings for asbestos. In most of these buildings he has assessed the condition of the asbestos-containing materials (ACM). The types of buildings have included industrial facilities, commercial buildings, institutional buildings, and residential buildings. His project sponsors have included private industry, state government agencies, federal government agencies, insurance companies and law firms. For the past 10 years he has been a consultant to the U.S. Public Health Service Federal Occupational Health (PHS/FOH) program for the southeast United States. Compass Environmental, Inc. charges \$185 per hour for his time. A CV is attached as Appendix A detailing his qualifications, experience, and publications. A listing of his deposition and trial testimony for the previous four years is also included.

At the request of Mr. Alan Runyan of Speights and Runyan I inspected the 100 Pine Street building in San Francisco, CA. The building is a high-rise office building with multiple tenants. The inspection occurred on January 6-7, 1998. Mr. Tod A. Dawson accompanied me during the inspection. On January 6th, Mr. Malcomb P. Bury, Chief Engineer for the building accompanied us through the building. On January 7th Mr. Ernie Horciza was our escort. Counsel for W.R. Grace & Co. and their technical experts were also present for the building inspection.

Previous bulk sampling of the spray-applied fireproofing identified the material as asbestos-containing. Constituent analysis conducted under the direction of James R. Millette, Ph.D. determined the fireproofing to be Mono-Kote (MK-3) brand manufactured by W.R. Grace and Co.¹ The fireproofing was spray-applied to columns, beams, and the corrugated metal deck. Overspray was observed on air supply ducts, hanger wires, and air induction units. Much of the fireproofing had been abated, and some abatement work was in progress during the inspection. The building management was removing the fireproofing in conjunction with planned renovation activities. The original MK-3 fireproofing also remained in the elevator shafts and air shafts of the building.

The fireproofing was assessed according to the U.S. Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) assessment methodology as damaged friable surfacing asbestos-containing building material (ACBM). The types of damage noted were physical damage likely due to contact by maintenance or service personnel, delamination of the fireproofing from the substrate (photograph 6 21:36), and damage probably due to vibration in the elevator shafts. Loose fireproofing debris was observed on ceiling tiles, base of the elevator shafts, base of the air shafts, and inside the air induction units (ventilation units).

The asbestos-containing fireproofing in this building is subject to the USEPA National Emission Standard for Hazardous Air Pollutants (NESHAP) for asbestos.² These regulations in San Francisco are enforced by the Bay Area Air Quality Control District (BAAQCD). The regulations require the friable asbestos-containing fireproofing be removed from the building prior to renovation or demolition activities that disturb the material. Due to the asbestos-containing fireproofing, the building owner, manager, and tenants are subject to the Occupational Safety and Health Administration (OSHA) asbestos regulations.³ These regulations are designed to reduce exposures in the workplace from the asbestos-containing material. The regulations require certain work practices be followed; protective equipment be provided when appropriate; notification and training of affected parties; labeling of asbestos-containing materials, areas with

¹ MVA, Inc. Report 100 Pine Street Building, Report No. MVA0257, 5500 Oakbrook Parkway, Suite 200, Norcross, GA 30093, April 24, 1992.

² USEPA, National Emission Standard for Hazardous Air Pollutants (NESHAP), Asbestos, 40 CFR Part 63, Subpart M.

³ Note: In California these regulations are enforced by CalOSHA.

asbestos, and asbestos waste; and other provisions. The building is also covered by California Proposition 65 regarding carcinogen warning.

Building owners have an obligation to eliminate or minimize exposure to asbestos in their facilities. Building owners can do this through implementation of an asbestos management program. An asbestos management program is a collection of procedures and special work practices designed to minimize asbestos exposures while the asbestos-containing material (ACM) remains in the building. The asbestos materials are typically removed during planned renovation activities or at building demolition. The 100 Pine Street building was under such a program at the time of the inspection, and conducting a phased removal program.

I have participated in several studies designed to evaluate exposures during various maintenance and remodeling activities in buildings. One study was designed to evaluate exposures during the installation of cables above suspended ceilings in buildings with Mono-Kote asbestos-containing fireproofing. The study was repeated to see if the results were reproducible.⁴ In the first study the activity resulted in an increase in the airborne concentration 590 times the concentration before the activity ($p < 0.0001$). In the replicate study the increase was 520 times ($p < 0.0001$).

During 1980-1981 I participated in a study of 11 office buildings with friable spray-applied structural fireproofing to characterize exposures during renovation activities.⁵ A total of 184 personal air samples were collected on carpenters, electricians, sheet-metal workers, and painters. The geometric mean exposures for these four job classifications were 0.13 f/cm³, 0.13 f/cm³, 0.19 f/cm³, and 0.08 f/cm³. The results found that 87.5 % of the samples were above 0.1 f/cm³, and 6 % were above 2.0 f/cm³. Removal of the fireproofing was not part of these renovation activities. This study demonstrated the episodic nature of exposures generated as a result of specific activities.

A series of eight studies were published in one article by Keyes, et al. in November 1994.⁶ This article looked at exposures during various custodial and maintenance activities in buildings with asbestos-containing surface treatments (acoustical plaster or fireproofing). This article confirmed again that direct disturbance of in-place friable ACM or the dust/debris from those materials can result in a significant increase in asbestos exposure.

⁴ Keyes, D.L., et al., "Exposure to Airborne Asbestos Associated with Simulated Cable Installation Above a Suspended Ceiling," *American Industrial Hygiene Association Journal*, Vol. 52, No. 11, 1991, pp. 479-484.

⁵ Paik, N.W., et al., "Worker Exposure to Asbestos During Removal of Sprayed Material and Renovation Activity in Buildings Containing Sprayed Material," *American Industrial Hygiene Association Journal*, Vol. 44, No. 6, 1983, pp.428-432.

⁶ Keyes, D.L., et al., "Baseline Studies of Asbestos Exposures During Operations and maintenance Activities," *Applied Occupational and Environmental Hygiene*, Vol. 9, No. 11, November 1994, pp.853-860.

It is my opinion the Mono-Kote fireproofing in the 100 Pine Street building in San Francisco released asbestos-containing dust and debris onto surfaces throughout the building. This fiber release, and the potential for resuspension of the asbestos dust from surfaces, is a source of exposure that must be controlled or eliminated. The in-place fireproofing itself is a source of exposure when directly disturbed. It was necessary and appropriate that an asbestos management program and an asbestos removal program be implemented to reduce exposures to asbestos from this fireproofing.

I hold the opinions expressed herein to a reasonable degree of scientific certainty. I also intend to rely upon my report, "Application and Use of Dust Sampling for Asbestos," dated December 7, 2005, previously submitted. I intend to illustrate my testimony using photographs taken in the 100 Pine Street building in January 1998.

This report prepared by:

William M. Ewing

WILLIAM M. EWING, CIH
Compass Environmental, Inc.
1751 McCollum Parkway
Kennesaw, Georgia 30144

Education

B.S., Biology, Washington and Lee University	1978
Courses in Management, Statistics, Technology and Science Policy (University of Michigan, Georgia State, Georgia Tech)	1978-1988
Short courses in industrial hygiene, toxicology, indoor air quality environmental site assessments, asbestos evaluation and control	1978-Present

Employment History

Compass Environmental, Inc.	1993-Present
Technical Director	
Diagnostic Engineering Inc.	1990-1993
Regional Technical Director	
The Environmental Management Group, Inc.	1987-1990
Executive Vice President	
Georgia Tech Research Institute	1981-1987
Research Associate II	
Clayton Environmental Consultants, Inc.	1978-1981
Industrial Hygienist	

Experience Summary

Mr. Ewing is the Technical Director for Compass Environmental, Inc. In this capacity he serves as project manager for industrial hygiene and indoor air quality studies and assessments. His technical responsibilities include project design, execution and report development for private and government project sponsors. He is also responsible for research studies, preparation of papers and publications, and quality assurance. He was the Executive Vice President of The Environmental Management Group, Inc. (TEMG) prior to its acquisition by Diagnostic Engineering Inc. (DEI), where he served as Regional Technical Director. While at the Georgia Tech Research Institute (GTRI) he started the industrial hygiene laboratory, instituted the hazardous waste program for small business in Georgia, and served as an industrial hygienist under the 7(c)(1) program, sponsored by the Occupational Safety and Health Administration (OSHA). As Director of the Asbestos Programs Group, he conducted training, technical assistance, and research on asbestos in buildings, under the sponsorship of the U.S. Environmental Protection Agency (USEPA).

During the past 25 years Mr. Ewing has conducted numerous industrial hygiene, asbestos management, and indoor air quality studies. In the field of industrial hygiene he has conducted over 300 field investigations including textile mills, foundries, steel mills, health care facilities, chemical plants, and manufacturing operations. Among the indoor air quality projects, his experience includes office settings, hospitals, and studies involving off-gassing of volatile compounds from products. He has served as a consultant to the Centers for Disease Control (CDC) on airborne microbial contamination, and is currently an industrial hygiene consultant to the U.S. Public Health Service. He is currently a consultant to the Georgia Building Authority where he conducts IAQ investigations and authored the State of Georgia IAQ manual. Since 1980, he has conducted environmental assessments for property owners, developers, mortgage bankers, and insurance companies. In the field of asbestos management and control, he has conducted surveys of over 1500 facilities, including commercial office buildings, schools, hospitals, ships, industrial plants, and government facilities.

William M. Ewing, CIH
Page 2

During the past 20 years, Mr. Ewing has frequently directed or lectured in training courses sponsored by universities, government agencies, and private interests. Topics have included respiratory protection, asbestos identification, evaluation, management, and control, advanced microscopy, polychlorinated biphenyls (PCBs), heavy metals, air pollution, industrial hygiene, and indoor air quality. He has directed over 50 courses and lectured in over 200 others throughout the continental United States, Alaska, Canada, and Europe.

Mr. Ewing participated in the site assessment of the aircraft carrier *USS Lexington* and development of its environmental management plan prior to its opening as a naval history museum. Much of this work involved PCBs, lead-based paint and asbestos identification and management. Mr. Ewing was responsible for preparing the Safety, Health and Emergency Response Plan (SHERP) and Contractor's Chemical Quality Control Program (CCQCP) for the fire site clean-up at Ft. Huachuca, Arizona. He has also conducted several studies related to flood or fire remediation in commercial and industrial facilities. Since 1988, he has participated in a series of studies designed to evaluate episodic exposures resulting from maintenance and custodial activities in buildings containing asbestos.

Certifications

American Board of Industrial Hygiene (ABIH)	1983
Certified Industrial Hygienist, Comprehensive Practice (Certificate No. 2627, Recertified 1990, 1995, 2002)	
Indoor Environmental Quality Sub-specialty Exam	1993
Inspector, pursuant to USEPA Asbestos Hazard Emergency Response Act (AHERA) regulations (40 CFR 763, Subpart E, Appendix C), Certificate No. 092, Georgia Institute of Technology; Current Certificate No. 3756-A, The Environmental Institute	1987-Present
Management Planner, pursuant to USEPA AHERA regulations, Certificate No. 083, Georgia Institute of Technology; Current Certificate No. 3756-A, The Environmental Institute	1987-Present
Project Designer, pursuant to USEPA AHERA regulations, Certificate No. 1438, The Environmental Institute; Current Certificate No. 1278-A, The Environmental Institute	1989-Present
Project Supervisor, pursuant to USEPA AHERA regulations, Certificate No. 3400, Georgia Institute of Technology; Current Certificate No. 3891-A, The Environmental Institute	1987-Present
State of Florida, Department of Professional Regulation, Licensed Industrial Hygienist/Asbestos Consultant (No. IA 0000003)	1989-Present

Awards and Honors

Georgia Tech Research Institute Award for Outstanding Performance in Program Development	1983
Commissioned Lieutenant Colonel, Aide de Camp, Governor's Staff by Governor Joe Frank Harris (State of Georgia)	1985
National Asbestos Council, President's Award Recipient	1987
National Asbestos Council, Outstanding Achievement Award	1988
Environmental Information Association, President's Award	1993
Elected Fellow Member Status, American Industrial Hygiene Association	1995
Practices Standards and Guidelines Committee Award, American Industrial Hygiene Association	2005
